

Folding of a catalytic RNA and engineering of intelligent ribozymes.

Jean-Pierre PERREAULT

Faculté de médecine et des sciences de la santé, Université de
Sherbrooke, CANADA

In order to understand more about RNA structure, the folding pathway of the ribozyme derived from the hepatitis delta virus was studied in intimate details, by far the most complex folding pathway elucidated to date for a catalytic pathway. In parallel, a ribozyme-based gene targeting system to inactivate key mRNAs involved in various diseases was developed.
